HOSPICE CARE

- Specialized health care, supportive in nature, provided to a dying person. A holistic approach is often taken, providing the patient and family with legal, financial, emotional or spiritual counseling in addition to meeting the patient's immediate needs. Care may be provided in the home, in the hospital, in hospices, or in specially designated areas of long-term care facilities. Bereavement care for the family is also included. Do not use /nursing; prefer precoordinated heading HOSPICE NURSING.

INTRA-AORTIC BALLOON PUMPING

Assisted circulation in which a pumping unit synchronized with the patient's electrocardiogram rapidly fills a balloon in the aorta with helium or carbon dioxide in early diastole and evacuates the balloon at the onset of systole. As the balloon inflates, it raises aortic diastolic pressure, and as it deflates, it lowers aortic systolic pressure. The result is a decrease in left ventricular work and increased myocardial and peripheral perfusion.

ISOMETRIC EXERCISES

- A form of active exercise that increases muscle tension by applying pressure against stable resistance. This may be accomplished by opposing different muscles in the same individual, as by pressing the hands together or by making a limb push or pull against an immovable object. There is no joint movement and the length of the muscle remains unchanged, but muscle strength and tone are maintained or improved.

ISOTONIC EXERCISES

- A form of active exercise in which the muscle contracts and causes movement. Throughout the procedure there is no significant change in the resistance so that the force of the contraction remains constant. Such exercise greatly improves joint mobility and helps to improve muscle strength and tone.

KIDNEY FAILURE, ACUTE

A clinical syndrome characterized by a sudden decrease in glomerular filtration rate, often to values of less than 1-2 ml per minute. It is usually associated with oliguria and always associated with biochemical consequences of the reduction in glomerular filtration rate such as a rise in blood urea nitrogen (BUN) and serum creatinine concentrations.

KIDNEY FAILURE, CHRONIC

An irreversible and usually progressive reduction in renal function in which both kidneys have been damaged by a variety of diseases to the extent that they are unable to adequately remove the metabolic products from the blood and regulate the body's electrolyte composition and acid-base balance. It requires HEMODIALYSIS or surgery, usually KIDNEY TRANSPLANTATION.

LARYNGEAL MASKS

- A type of oropharyngeal airway that provides an alternative to endotracheal intubation and standard mask anesthesia in certain patients. It is introduced into the hypopharynx to form a seal around the larynx thus permitting spontaneous or positive pressure ventilation without penetration of the larynx or esophagus.

MAGNETIC RESONANCE IMAGING

- Non-invasive method of demonstrating internal anatomy based on the principle that certain nuclei in a strong magnetic field absorb pulses of radiofrequency energy and emit them as radiowaves which can be reconstructed into computerized images. Coordinate with Specific Disease/diagnosis, not /radiography.
- Searchable electronically since 1983.

MYOCARDIAL ISCHEMIA

A disorder of cardiac function caused by insufficient blood flow to the muscle tissue of the heart. MYOCARDIAL REPERFUSION

Generally, restoration of blood supply to heart tissue which is ischemic due to decrease in normal blood supply. The decrease may result from any source including atherosclerotic obstruction, narrowing of the artery, or surgical clamping. Reperfusion can be induced to treat ischemia. Methods include chemical dissolution of an occluding thrombus, administration of vasodilator drugs, angioplasty, catheterization, and artery bypass graft surgery. However, it is thought that reperfusion can itself further damage the ischemic tissue, causing MYOCARDIAL REPERFUSION INJURY.

NURSING ASSESSMENT

An identification by a nurse of the needs, preferences, and abilities of a patient. Assessment follows an interview with and observation of a patient by the nurse and considers the signs and symptoms of the condition, the patient's verbal and nonverbal communication, medical and social history, and any other information available. It is the first stage of the nursing process.
